-I- FUNCTION: THROMBIN, WHICH CLEAVES BONDS AFTER ARG & LYS, CONVERTS

FIBRINGEN TO FIBRIN AND ACTIVATES FACTORS V, VII, VIII, XIII,

AND, IN COMPLEX WITH THROMBOWDOLLIN, PROTEIN C.

-I- CATALYTIC ACTIVITY: Preferential cleavage: Arg-I-Gly; activates

-I- SIDECLIDIAR LOCATION: Extracellular.

-I- TISSUE SPECIFICITY: SYNTHESIZED IN THE LIVER; FOUND IN PLASMA.

-I- TISSUE SPECIFICITY: SYNTHESIZED IN THE LIVER; FOUND IN PLASMA.

-I- PTM: THE GAMMA-CARBOXYLGUTAMYL RESIDUES WITH MODIFIED RESIDUES

-I- PTM: THE GAMMA-CARBOXYLGUTAMYL RESIDUES WITH MODIFIED RESIDUES

-I- PTM: THE GAMMA-CARBOXYLGUTAMYL RESIDUES WITH MODIFIED RESIDUES

-I- PTM: THE VITAMIN TO PERDENDENT CARBOXYLASE. THE MODIFIED RESIDUES

-I- MISCELLANBOUS: PROTHROMBIN IS ACTIVATED ON THE SURFACE OF A PROSPHOLIPID MEMBRANE THAT BINDS THE AMINO END OF PROTHROMBIN E CLEAVES THE REMAINING PART INTO LIFE OF THE ACTIVATION PROCESS STARTS SLOWIX BECAUSE FACTOR THE ACTIVATION PROFILE A CHEAVES THE REMAINING PART INTO LIFE OF THE MODIFIED FACTOR.

--- THE ACTIVATION PROPILE INTIBAL, SMALL AMOUNTS OF THE MODIFIED AMENDED.

Proc. Natl. Acad. Sci. U.S.A. 89:2779-2783(1992).

C. - FUNCTION: THROMBIN, WHICH CLEAVES BONDS AFTER RG & LYS, CONVERTS CONVERTS WIN COMPLEX WITH THROMBOMODULIN, PROTEIN C.

- FUNCTION: THROMBIN, WHICH CLEAVES BONDS AFTER RG & LYS, CONVERTS C.C.

- AND, IN COMPLEX WITH THROMBOMODULIN, PROTEIN C.

- TOTALITICA ACTIVITY: Preferential cleaves fibrinopeptide A and B.

C. - PTH: THE GAMMA-CARBOXYCLATION OF GLUTAWYL RESIDUES BY A MICROSOMAL RESULT FROM THE CARBOXYLATION OF GLUTAWYL RESIDUES BY A MICROSOMAL ENTANE, THE VITAMIN R-DEPENDENT CARBOXYLASE. THE MODIFIED RESIDUES CC CHARGED PHOSPHOLIPID SURFACE, WHICH IS ESSENTIAL FOR THE CONVERSION OF PROTHROMBIN TO THROMBIN.

- PHOSPHOLIPID MEMBRANE THAT BINDS THE AMINO END OF PROTHROMBIN & PROCESS THE REMAINING PART INTO LIGHT & HEAVY CHAINS. THE ACTIVATED BY THE INITIAL, SMALL AMOUNTS OF MUDDALIN.

- THEAVY CHAINS. THE ACTIVATED BY THE INITIAL, SMALL AMOUNTS OF MUDDALING.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright. ITEMICATION: RESPONSIBLE FOR THE DEGRADATION OF VITELLIN IN EGGS AT THE HEAD PICHENTARION STAGE.
I- DEVELOPMENTAL STAGE: APPEARED ON EGG DAY 7.5, BECAME MORE ACTIVE ON DAY 8-8.5 AND DISAPPEARED ON DAY 9.5.
I- PTM: CLEAVAGE AFTER ARG-27 LEADS TO BETA-VTN PROTEASE AND SUBSEQUENT CLEAVAGE AFTER ARG-89 LEADS TO ALPHA-VTN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                            AND VILIA.
SURDNIT: SYNTHESIZED AS A SINGLE CHAIN PRECURSOR, WHICH IS CLEAVED INTO A LIGHT CHAIN AND A HEAVY CHAIN HELD TOGETHER BY A DISULFIDE BOND. THE ENZYME IS THEN ACTIVATED BY THROMBIN, WHICH CLEAVES A TETRADECAPEPTIDE FROM THE AMINO END OF THE HEAVY CHAIN; THIS REACTION, WHICH OCCURS AT THE SURFACE OF ENDOTHELIAL CELLS, IS STRONGLY PROMOTED BY THROMBOWDULLIA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Blood coagulation; Glycoprotein; Serine protease; Gamma-carboxyglutamic acid; Calcium-binding; Vitamin K; Hydroxylation; EGF-like domain; Repeat; Endothelial cell; Hydrolase; Signal. NON_TER
                            TISSUE SPECIFICITY: PLASMA; SYNTHESIZED IN THE LIVER.
PTM: THE VITAMIN R-DEPENDENT, ENZIMATIC CARBOXILATION OF SOME
GEU RESIDUES ALLOWS THE MODIFIED PROTEIN TO BIND CALCIUM.
MISCELLANBOUS: CALCIUM ALSO BINDS, WITH STRONGER AFFIXITY TO
ANOTHER SITE, BEYOND THE GLA DOMAIN. THIS GLA-INDEPENDENT BINDING
SITE IS NECESSARY FOR THE RECCGNITION OF THE
THROMBIN-THROMBOMODULIN COMPLEX.
SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI.
SIMILARITY: CONTAINS 2 EGF-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    BY SIMILARITY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to ERA binding domain polypeptides ARG99559-AAG999989 and AAW00010-AAW00021). The era gene in Escherichia coli codes for an essential GFPase protein able to autophosphorylate at serine and/or threonine residues. The protein has potential antimicrobial and antibacterial activity and is useful in screening for antagonists, agonists and for compounds with antibiotic activity. The proteins are also useful in determining their role in pathogenesis of infection, dysfunction and disease and could be used as part of a vaccine and/or
                                                                              (AAG95559-AAG99999 and AAM00010-AAM00021). The era gene in Escherichia coli codes for an essential Grease protein able to autophosphorylate at serine and/or incenine residues. The protein has potential antimicrobial and antibacterial activity and is useful in screening for antagonists, agonists and for compounds with antibiotic activity. The proteins are also useful in determining their role in pathogenesis of infection, dysfunction and disease and could be used as part of a vaccine and/or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half

The N-terminal amino acids of the peptides of AAR29095-96 are linked by -C(0) paraphenylene-C(0). The cpd has an anti-inflammatory effect useful in the treatment of gout, rheumatoid arthritis and other inflammatory diseases and to prevent elastin mediated issue damage. It can also be used in the treatment of emphysema and adult respiratory distress syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             linked by -C(0) paraphenylene-C(0).

"Linked via a linking chain such as -CO-phenylene-CO- to the N-terminal of a Cathepsin G inhibiting molecule as described in AAR38410-11"
                                                                                                                                                                                                                                 sequences given in AAR38407-09 are elastase inhibiting peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    May opt. be modified by COCOR, CF2CF3, CF3, CHE2, COOR3, CONNAI, CF2CHR3CONHE, H, alkyl, arryl, aralkyl or COR; where R3 is H, alkyl, phenyl or benzyl and R is OH or alkoxy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inflammatory disease; prevention; rheumatoid arthritis; emphysema; neutrophil-mediated connective tissue degradation; gout; elastase; inhibition; adult respiratory distress syndrome.
                                                                                                                                                                                                                                                 which were produced by standard peptide synthesis methods. In the context of the invention they are linked via their N-termini to a Cathepsin G inhibiting peptide (see features table). The peptide conjugates may be used to prevent neutrophil-mediated connective
                                                                                                                                                                                                                                                                                                     tissue degradation associated with inflammatory diseases eg. gout and rheumatoid arthritis. They may also be used for preventing elastin-mediated tissue damage in the treatment of emphysema and

                                                                                                                                                                                                        which were produced by standard peptide synthesis methods. In the context of the invention they are linked via their N-termini to a Cathepsin G inhibiting peptide (see features table). The peptide conjugates may be used to prevent neutrophil-mediated connective tissue degradation associated with inflammatory diseases eg. gout and rheumatoid arthritis. They may also be used for preventing elastin-mediated tissue damage in the treatment of emphysema and

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 1, App

Patent No. 6320024
GENERAL INFORMATION
TITLE OF INVENTION: Method for Design of Substances that Enhance Memory and
TITLE OF INVENTION: Improve the Quality of Life
TITLE OF INVENTION: Improve the Quality of Life
TITLE OF INVENTION: Improve the Quality of Life
CURRENT APPLICATION NUMBER: US/09/264,709A
CURRENT APPLICATION NUMBER: 08/79/782
PRIOR FILING DATE: 1999-03-09
PRIOR FILING DATE: 1997-02-07
NUMBER OF SEQ ID NOS: 39
SOFTWARE: Patentin Ver. 2.1
SEQ ID NO. 29

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Title: US-09-909-348-4

Perfect score: 4
Sequence: 1 V 1
Scoring table: BLOSUM62
Gapop 10.0 , Gapext 0.5

Searched: 112892 seqs, 41476328 residues

Total number of hits satisfying chosen parameters: 112892
Minimum DB seq length: 0
Maximum DB seq length: 2000000000

Post-processing: Minimum Match 0%
Maximum Match 100%
Listing first 45 summaries
Database : Swissprot_40:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"N-terminal sequence analysis of N alpha-acetylated proteins after
unblocking with N-acylaminoacyl-peptide hydrolase.";
Anal. Blochem. 199:45-50(1991).
-I- FUNCTION: THIS ENZYME CATALZES THE HYDROLYSIS OF THE AMINO-
TERMINAL PEPTIDE BOND OF AN N-ACETYLATED PEPTIDE TO GENERATE
AN N-ACETYLATED AA AND A PEPTIDE WITH A FREE AMINO-TERMINUS.
IT PREFERENTIALLY CLEAVES OFF AC-ALA, AC-MET AND AC-SER
                                                                                    genome analysis program.";
Theor. Appl. Genet. 93:997-1005(1996).
-I- MISCELLANEOUS: ON THE 2DE THE DETERMINED PI OF THIS UNKNOWN
PROTEIN IS: 6.1, ITS MW IS: 30.4 kDa.

Genetic defect of bilitubin UDP-glucuronosyltransferase in the hyperbilitubinemic Gunn rat.";

L Blochem. Blophys. Res. Commun. 177:1161-1164(1991).

C -I FUNCTION: UDPGT IS OF MAJOR IMPORTANCE IN THE CONJUGATION AND ENDGENOUS COMPOUNDS.

C -I CATALYTIC ACTIVITY: UDP-GLUCURONATE + ACCEPTOR = UDP + ACCEPTOR BETA-D-GLUCORONOSIDE.

C -I SUBCELLULAR LOCATION: MICROSOME.
